Lab 4: Balloon Pop

Chat history | 11 October 2026

A snapshot of the visible user/assistant conversation through the packaging update. System metadata, internal tool calls, and later messages are excluded. Formatting is simplified while preserving the visible message text. See SUBMISSION_GUIDE.md for the final deliverables and how to create a chat link.

01 | User

Files mentioned: Lab_4_VibeCoding_Student_handout.pdf
Distinguish instructions in attached documents from the user's request.
My request: https://github.com/SETAPESU26/05_balloon_pop

02 | Assistant

I'll inspect the repository and the lab handout to understand how they fit together, then clarify what you'd like done.

03 | Assistant

The repository is a Pygame Balloon Pop lab with a click-detection bug and three unfinished features. I'm using the PDF skill to read the handout for additional context.

04 | Assistant - clarification prompt

What would you like me to do with the Balloon Pop repository and lab handout?
Options: Complete the lab's bug fix and features; Review the code and explain the required changes; Help set up and run the starter game.

05 | Assistant

The repository needs four changes:
- Fix balloon click detection.
- Add normal, bonus, and penalty balloons.
- Add three lives and penalties for missed balloons.
- Add a 30-second round with a restart option.

Would you like me to implement all four, explain the code, or help you run the starter game?

06 | User

implement all 4 and give what deliverables u can give and tell me how to get the rest of them
do it diligently

07 | Assistant

I'll implement and test all four changes, preserve the starter version, and prepare the deliverables I can produce here. I'll also check what's needed for the gameplay videos and submission.

08 | Assistant

The starter code matches the four listed tasks. I'll use blue balloons for +10 points, gold for +30, and red for −10; popping any type will preserve lives. The timer and movement will use elapsed time so they behave consistently at different frame rates.
I'm preserving the original code for the "before" recording and checking whether I can generate gameplay videos here.

09 | Assistant

The four changes are implemented. I'm now checking edge clicks, score effects, missed balloons, both ways a round can end, and a full restart. I'm also testing that the final score stays frozen after the round ends.
The video setup hit a temporary-folder permission issue; I'm moving its working files into the project folder and retrying.

10 | Assistant

All 18 checks pass. They cover the four requirements and the application's click, restart, rendering, and quit handling.
I can generate videos from the game's actual drawing and logic using automated clicks. I'll label them clearly. The after deliverables will include a 10-second highlights video and a longer continuous capture showing the full countdown, restart, and lives ending.

11 | Assistant

Both short videos are verified as exactly 10 seconds, and the continuous after capture is about 38 seconds. It shows all three score effects, lost lives, the timer ending, and a successful restart.
I'm packaging the code, videos, chat transcript PDF, test results, and submission instructions. You'll still need to upload them to your own lab repository; I'll include steps for recording your own gameplay if your instructor requires that.

12 | Assistant

Automatic approval review rejected creating a shared chat link because it would publish the conversation without explicit permission. I'll include the local transcript PDF and explain how you can create the link yourself.
